Brief Abstract

DESCRIPTION

This measure is used to assess whether the practice can produce a register of patients with chronic obstructive pulmonary disease (COPD).

RATIONALE

Chronic obstructive pulmonary disease (COPD) is a common disabling condition with a high mortality. The most effective treatment is smoking cessation. Oxygen therapy has been shown to prolong life in the later stages of the disease and has also been shown to have a beneficial impact on exercise capacity and mental state. Some patients respond to inhaled steroids. Many patients respond symptomatically to inhaled beta agonists and anti-cholinergics. Pulmonary rehabilitation has been shown to produce an improvement in quality of life.

The majority of patients with COPD are managed by general practitioners and members of the primary healthcare team with onward referral to secondary care

when required. This measure is one of five [Chronic Obstructive Pulmonary Disease \(COPD\)](#) measures. The Chronic Obstructive Pulmonary Disease (COPD) set focuses on the diagnosis and management of patients with symptomatic COPD.

PRIMARY CLINICAL COMPONENT

Chronic obstructive pulmonary disease (COPD); patient registry

DENOMINATOR DESCRIPTION

This measure applies to practices with a chronic obstructive pulmonary disease (COPD) patient population (one practice at a time).

NUMERATOR DESCRIPTION

The practice can produce a register of patients with chronic obstructive pulmonary disease (COPD).
